AMENDMENTS TO CLAIMS

This listing of claims will replace all prior version, and listings, of the claims in the application.

1 1. (Previously presented) A method for managing data, comprising:

maintaining a plurality of persistent data items on persistent storage accessible to a

  plurality of nodes, the persistent data items including a particular data item

  stored at a particular location on said persistent storage;

assigning exclusive ownership of each of the persistent data items to one of the nodes,

  wherein a particular node of said plurality of nodes is assigned exclusive

  ownership of said particular data item;

when any node wants an operation performed that involves said particular data item,

  the node that desires the operation to be performed ships the operation to the

  particular node for the particular node to perform the operation on the

  particular data item while said particular data item continues to reside at said

  particular location;

reassigning ownership of the particular data item from the particular node to another

  node without moving the particular data item from said particular location on

  said persistent storage;

after the reassignment, when any node wants an operation performed that involves

  said particular data item, the node that desires the operation to be performed

  ships the operation to said other node for the other node to perform the

  operation on the particular data item while said particular data item continues

  to reside at said particular location,

wherein:

  said persistent storage is a first persistent storage of a plurality of persistent

   storages used by a multi-node database system,

  the method further comprises reassigning ownership of a second data item

   from a first node that has access to said first persistent storage to a

   second node that has access to a second persistent storage but does not

   have access to said first persistent storage, and

28		the method further comprises reassigning ownership of the second data item
29		by moving the second data item from said first persistent storage to
30		said second persistent storage.

1	2.	(Original) The method of Claim 1 wherein the step of reassigning ownership of the
2		particular data item from the particular node to another node includes updating an
3		ownership map that is shared among the plurality of nodes.

1	3.	(Previously presented) The method of Claim 5, wherein the plurality of nodes are
2		nodes of a multi-node database system.

1	4.	(Previously presented) The method of Claim 3 wherein the multi-node database
2		system includes nodes that do not have access to said first persistent storage.

1	5.	(Previously presented) A method for managing data, comprising:
2		maintaining a plurality of persistent data items on persistent storage accessible to a
3		plurality of nodes, the persistent data items including a particular data item
4		stored at a particular location on said persistent storage;
5		assigning exclusive ownership of each of the persistent data items to one of the nodes,
6		wherein a particular node of said plurality of nodes is assigned exclusive
7		ownership of said particular data item;
8		when any node wants an operation performed that involves said particular data item,
9		the node that desires the operation to be performed ships the operation to the
10		particular node for the particular node to perform the operation on the
11		particular data item;
12		while the particular node continues to operate, reassigning ownership of the particular
13		data item from the particular node to another node;
14		after the reassignment, when any node wants an operation performed that involves
15		said particular data item, the node that desires the operation to be performed
16		ships the operation to said other node for the other node to perform the
17		operation on the particular data item,
18		wherein:

19   said persistent storage is a first persistent storage of a plurality of persistent

20   storages used by said multi-node database system; and

21   the method further comprises reassigning ownership of a second data item

22   from a first node that has access to said first persistent storage to a

23   second node that has access to a second persistent storage but does not

24   have access to said first persistent storage; and

25   wherein the step of reassigning ownership of the second data item includes

26   moving the second data item from said first persistent storage to said

27   second persistent storage.

1   6.   (Original) The method of Claim 3 wherein the step of reassigning ownership of the

2   particular data item from the particular node to another node is performed in response

3   to the addition of said other node to said multi-node database system.

1   7.   (Original) The method of Claim 3 wherein:

2   the step of reassigning ownership of the particular data item from the particular node

3   to another node is performed in anticipation of the removal of said particular

4   node from said multi-node database system; and

5   the method further comprises the step of, in anticipation of the removal of said

6   particular node from said multi-node database system, physically moving

7   from said persistent storage to another persistent storage a second data item

8   that is reassigned from said particular node to a node of said multi-node

9   database system that does not have access to said persistent storage.

1   8.   (Original) The method of Claim 3 wherein the step of reassigning ownership of the

2   particular data item from the particular node to another node is performed as part of a

3   gradual transfer of ownership from said particular node to one or more other nodes.

1   9.   (Original) The method of Claim 8 wherein the gradual transfer is initiated in response

2   to detecting that said particular node is overworked relative to one or more other

3   nodes in said multi-node database system.

1   10.   (Previously presented) A method for managing data, comprising:

2		maintaining a plurality of persistent data items on persistent storage accessible to a
3		plurality of nodes, the persistent data items including a particular data item
4		stored at a particular location on said persistent storage,
5		wherein the plurality of nodes are nodes of a multi-node database system;
6		assigning exclusive ownership of each of the persistent data items to one of the nodes,
7		wherein a particular node of said plurality of nodes is assigned exclusive
8		ownership of said particular data item;
9		when any node wants an operation performed that involves said particular data item,
10		the node that desires the operation to be performed ships the operation to the
11		particular node for the particular node to perform the operation on the
12		particular data item;
13		while the particular node continues to operate, reassigning ownership of the particular
14		data item from the particular node to another node;
15		wherein the step of reassigning ownership of the particular data item from the
16		particular node to said other node is performed as part of a gradual transfer of
17		ownership from said particular node to one or more other nodes in said multi-
18		node database system,
19		wherein the gradual transfer is initiated in response to detecting that said particular
20		node is overworked relative to the one or more other nodes,
21		wherein the gradual transfer is terminated in response to detecting that said particular
22		node is now longer overworked relative to the one or more other nodes; and
23		after the reassignment, when any node wants an operation performed that involves
24		said particular data item, the node that desires the operation to be performed
25		ships the operation to said other node for the other node to perform the
26		operation on the particular data item.

1	11.	(Previously presented) A method for managing data, comprising:
2		maintaining a plurality of persistent data items on persistent storage accessible to a
3		plurality of nodes, the persistent data items including a particular data item
4		stored at a particular location on said persistent storage,
5		wherein the plurality of nodes are nodes of a multi-node database system;

6   assigning exclusive ownership of each of the persistent data items to one of the nodes,

7   wherein a particular node of said plurality of nodes is assigned exclusive

8   ownership of said particular data item;

9   when any node wants an operation performed that involves said particular data item,

10   the node that desires the operation to be performed ships the operation to the

11   particular node for the particular node to perform the operation on the

12   particular data item;

13   while the particular node continues to operate, reassigning ownership of the particular

14   data item from the particular node to another node;

15   wherein the step of reassigning ownership of the particular data item from the

16   particular node to another node is performed as part of a gradual transfer of

17   ownership to said other node by one or more other nodes, wherein said

18   gradual transfer is initiated in response to detecting that said other node is

19   underworked relative to the one or more other nodes in said multi-node

20   database system;

21   after the reassignment, when any node wants an operation performed that involves

22   said particular data item, the node that desires the operation to be performed

23   ships the operation to said other node for the other node to perform the

24   operation on the particular data item.

1   12.   (Previously presented) A method for managing data, comprising:

2   maintaining a plurality of persistent data items on persistent storage accessible to a

3   plurality of nodes, the persistent data items including a particular data item

4   stored at a particular location on said persistent storage;

5   assigning exclusive ownership of each of the persistent data items to one of the nodes,

6   wherein a particular node of said plurality of nodes is assigned exclusive

7   ownership of said particular data item;

8   when any node wants an operation performed that involves said particular data item,

9   the node that desires the operation to be performed ships the operation to the

10   particular node for the particular node to perform the operation on the

11   particular data;

12	while the particular node continues to operate, reassigning ownership of the particular
13	data item from the particular node to another node;
14	after the reassignment, when any node wants an operation performed that involves
15	said particular data item, the node that desires the operation to be performed
16	ships the operation to said other node for the other node to perform the
17	operation on the particular data item; and
18	after a first node has been removed from the multi-node system, continuing to have a
19	set of data items owned by the first node.

1	13.	(Previously presented) The method of Claim 12, further comprising:
2		reassigning ownership of a data item from the first node to a second node in response
3		to detecting that the workload of said second node has fallen below a
4		predetermined threshold.

1	14.	(Original) The method of Claim 1 wherein:
2		at the time said particular data item is to be reassigned to said other node, the
3		particular node stores a dirty version of said particular data item in volatile
4		memory; and
5		the step of reassigning ownership of the particular data item from the particular node
6		to another node includes writing said dirty version of said particular data item
7		to said persistent storage.

1	15.	(Previously presented) A method for managing data, comprising:
2		maintaining a plurality of persistent data items on persistent storage accessible to a
3		plurality of nodes, the persistent data items including a particular data item
4		stored at a particular location on said persistent storage;
5		assigning exclusive ownership of each of the persistent data items to one of the nodes,
6		wherein a particular node of said plurality of nodes is assigned exclusive
7		ownership of said particular data item;
8		when any node wants an operation performed that involves said particular data item,
9		the node that desires the operation to be performed ships the operation to the

10   particular node for the particular node to perform the operation on the

11   particular data item;

12 while the particular node continues to operate, reassigning ownership of the particular

13   data item from the particular node to another node,

14 wherein:

15   at the time said particular data item is to be reassigned to said other node, the

16   particular node stores a dirty version of said particular data item in

17   volatile memory; and

18   the step of reassigning ownership of the particular data item from the

19   particular node to another node includes forcing to persistent storage

20   one or more redo records associated with said dirty version, and

21   purging said dirty version from said volatile memory without writing

22   said dirty version of said particular data item to said persistent storage;

23   and

24   said other node reconstructs said dirty version by applying said one or more

25   redo records to the version of the particular data item that resides on

26   said persistent storage.

1   16.   (Previously presented) A method for managing data, comprising:

2   maintaining a plurality of persistent data items on persistent storage accessible to a

3   plurality of nodes, the persistent data items including a particular data item

4   stored at a particular location on said persistent storage;

5   assigning exclusive ownership of each of the persistent data items to one of the nodes,

6   wherein a particular node of said plurality of nodes is assigned exclusive

7   ownership of said particular data item;

8   when any node wants an operation performed that involves said particular data item,

9   the node that desires the operation to be performed ships the operation to the

10   particular node for the particular node to perform the operation on the

11   particular data item;

12 while the particular node continues to operate, reassigning ownership of the particular

13   data item from the particular node to another node,

14 wherein:

15		at the time said particular data item is to be reassigned to said other node, the
16		particular node stores a dirty version of said particular data item in
17		volatile memory; and
18		the method further includes the step of transferring the dirty version of said
19		particular data item from volatile memory associated with said
20		particular node to volatile memory associated with said other node.

1	17.	(Original) The method of Claim 16 wherein the step of transferring the dirty version
2		is performed proactively by the particular node without the other node requesting the
3		dirty version.

1	18.	(Original) The method of Claim 16 wherein the step of transferring the dirty version
2		is performed by the particular node in response to a request for the dirty version from
3		said other node.

1	19.	(Previously presented) A method for managing data, comprising:
2		maintaining a plurality of persistent data items on persistent storage accessible to a
3		plurality of nodes, the persistent data items including a particular data item
4		stored at a particular location on said persistent storage;
5		assigning exclusive ownership of each of the persistent data items to one of the nodes,
6		wherein a particular node of said plurality of nodes is assigned exclusive
7		ownership of said particular data item;
8		when any node wants an operation performed that involves said particular data item,
9		the node that desires the operation to be performed ships the operation to the
10		particular node for the particular node to perform the operation on the
11		particular data item;
12		reassigning ownership of the particular data item from the particular node to another
13		node,
14		wherein:
15		the step of reassigning ownership of the particular data item from the
16		particular node to another node is performed without waiting for a
17		transaction that is modifying the data item to commit;

18	the transaction makes a first set of modifications while the particular data item
19	is owned by the particular node; and
20	the transaction makes a second set of modifications while the particular data
21	item is owned by said other node.

1 20. (Original) The method of Claim 19 further comprising rolling back changes made by
2 said transaction by rolling back the second set of modifications based on undo records
3 in an undo log associated with said other node, and rolling back the first set of
4 modifications based on undo records in an undo log associated with said particular
5 node.

1 21. (Previously presented) A method for managing data, comprising:
2 maintaining a plurality of persistent data items on persistent storage accessible to a
3 plurality of nodes, the persistent data items including a particular data item
4 stored at a particular location on said persistent storage;
5 assigning exclusive ownership of each of the persistent data items to one of the nodes,
6 wherein a particular node of said plurality of nodes is assigned exclusive
7 ownership of said particular data item;
8 when any node wants an operation performed that involves said particular data item,
9 the node that desires the operation to be performed ships the operation to the
10 particular node for the particular node to perform the operation on the
11 particular data item;
12 while the particular node continues to operate, reassigning ownership of the particular
13 data item from the particular node to another node;
14 the other node receiving a request to update said data item;
15 determining whether the particular node held exclusive-mode or shared-mode access
16 to the data item; and
17 if the particular node did not hold exclusive-mode or shared-mode access to the data
18 item, then the other node updating the particular data item without waiting for
19 the particular node to flush any dirty version of the data item, or redo for the
20 dirty version, to persistent storage.

1   22.   (Previously presented) The method of Claim 1 further comprising the steps of:

2   in response to transferring ownership of said particular data item to said other node,

3   aborting an in-progress operation that involves said particular data item;

4   after ownership of the particular data item has been transferred to said other node, re-

5   executing the in-progress operation.

1   23.   (Original) The method of Claim 1 wherein:

2   an operation that involves said particular data item is in-progress at the time the

3   transfer of ownership of said particular data item is to be performed;

4   the method further includes the step of determining whether to wait for said in-

5   progress operation to complete based on a set of one or more factors; and

6   if it is determined to not wait for said in-progress operation to complete, aborting said

7   in-progress operation.

1   24.   (Original) The method of Claim 23 wherein said set of one of more factors includes

2   how much work has already been performed by said in-progress operation.

1   25.   (Previously presented) A method of managing data, the method comprising the steps

2   of:

3   maintaining a plurality of persistent data items on persistent storage accessible to a

4   plurality of nodes;

5   assigning ownership of each of the persistent data items to one of the nodes by

6   assigning each data item to one of a plurality of buckets by enumerating

7   individual data-item-to-bucket relationships; and

8   assigning each bucket to one of the plurality of nodes by enumerating

9   individual bucket-to-node relationships;

10   wherein the node to which a bucket is assigned is established to be owner of

11   all data items assigned to the bucket;

12   when a first node wants an operation performed that involves a data item owned by a

13   second node, the first node ships the operation to the second node for the

14   second node to perform the operation.

1   26.   (Original) The method of Claim 25 wherein the step of assigning each data item to
2   one of a plurality of buckets is performed by applying a hash function to a name
3   associated with each data item.

1   27.   (Original) The method of Claim 25 wherein the step of assigning each bucket to one
2   of the plurality of nodes is performed by applying a hash function to an identifier
3   associated with each bucket.

1   28.   (Original) The method of Claim 25 wherein the step of assigning each data item to
2   one of a plurality of buckets is performed using range-based partitioning.

1   29.   (Original) The method of Claim 25 wherein the step of assigning each bucket to one
2   of the plurality of nodes is performed using range-based partitioning.

1   30-31. (Cancelled).

1   32.   (Original) The method of Claim 25 wherein the number of buckets is greater than the
2   number of nodes, and the bucket-to-node relationship is a many-to-one relationship.

1   33.   (Original) The method of Claim 25 further comprising the step of reassigning from a
2   first node to a second node ownership of all data items that are mapped to a bucket by
3   modifying a bucket-to-node mapping without modifying a data-item-to-bucket
4   mapping.

1   34.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more
2   sequences of instructions which, when executed by one or more processors, causes
3   the one or more processors to perform the method recited in Claim 1.

1   35.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more
2   sequences of instructions which, when executed by one or more processors, causes
3   the one or more processors to perform the method recited in Claim 2.

1   36.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 3.

1   37.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 4.

1   38.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 5.

1   39.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 6.

1   40.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 7.

1   41.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 8.

1   42.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 9.

1   43.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 10.

1   44.   (Currently amended) A computer-readable storage medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 11.

1   45.   (Currently amended) A computer-readable storage medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 12.

1   46.   (Currently amended) A computer-readable storage medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 13.

1   47.   (Currently amended) A computer-readable storage medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 14.

1   48.   (Currently amended) A computer-readable storage medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 15.

1   49.   (Currently amended) A computer-readable storage medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 16.

1   50.   (Currently amended) A computer-readable storage medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 17.

1   51.   (Currently amended) A computer-readable storage medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 18.

1   52.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 19.

1   53.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 20.

1   54.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 21.

1   55.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 22.

1   56.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 23.

1   57.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 24.

1   58.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 25.

1   59.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 26.

1   60.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 27.

1   61.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 28.

1   62.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 29.

1   63-64. (Cancelled).

1   65.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 32.

1   66.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 33.

1   67.   (Original) A method for use in a multi-node shared-nothing database system, the

2   method comprising the steps of:

3   a first node of said multi-node shared-nothing database system initially functioning as

4   exclusive owner of a first data item and a second data item, wherein said first

5   data item and said second data item are persistently stored data items within a

6   database managed by the multi-node shared-nothing database system;

7   without changing the location of a first data item on persistent storage or shutting

8   down said first node, reassigning ownership of the first data item from the first

9   node to a second node of said multi-node shared-nothing database system; and

10   after reassigning ownership, the first node continuing to operate as the owner of the

11   second data item, and to handle all requests for operations on said second data

12   item.

1 68.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 67.

1 69.   (Previously presented) The method of Claim 12, further comprising:

2   reassigning ownership of data items from the first node to one or more other nodes in

3   response to detecting requests for operations that involve said data items.

1 70.   (Currently amended) A computer-readable <u>storage</u> medium carrying one or more

2   sequences of instructions which, when executed by one or more processors, causes

3   the one or more processors to perform the method recited in Claim 69.
